Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Center code: WIBR

It currently consists of 45 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

New plant pathogen hypersensitive response elicitor-receptor protein isolated from plants, which upon silencing is used to study plant signal transduction pathways leading to disease resistance and growth enhancement

Disclosure; Page 19; 78pp; English,

and insects through HRE treatment. The protein is useful for understanding the harpin (Erwinia amylovora hypersensitive response understanding the harpin (Erwinia amylovora hypersensitive response elicitor) induced signal transduction pathway in plants. The protein is useful for studying the downstream components of signal transduction pathway in plants which eventually leads to disease resistance, growth enhancement, insect control and stress resistance. Imparting disease resistance to plants through HRE treatment has the potential to treat previously untreatable diseases, treating diseases systemically which might not be treated separately due to cost and avoids the use of infectious agents or environmentally harmful materials. By HRE treatment increased quantity of seeds produced, increased percentage of seeds germinated, increased plant size, greater biomass, more and bigger fruits, etc. which results in economic benefit to cultivators. Greater yield, increased size and enhanced biomass allow greater revenue generation from the given plot of plant. The present sequence is synches, cons The present invention relates to an isolated protein which serves as a receptor in plants for plant pathogen hypersensitive response elicitors (HME). The plants are made resistant to infection by viruses, bacteria and fungi and are imparted with resistance against environmental stress

encoding silk protesin. The production of a DNA fragment encoding silk protesin. The process involves: (a) selecting target DNA, from a silk-producing spider, that contains many repetitive and non-repetitive regions; (b) selecting a single-stranded DNA primer of at least 10 nucleotides with a sequence that is complementary to a region of the target; (c) repetitively combining the primer with melted target. DNA, incubating the mixture with nucleotides and a DNA polymerase with profereding activity to produce a DNA fragment which is complementary to the target and is at least 2 kb long. The present sequence represents a 2 kb DNA sequence which encodes the spider silk protein from Nephila clavipes. The DNA fragment can be used to make fibres, films, woven articles, e.g. for use in parachutes, sails, body armour, and absorbers (e.g. of heavy metals, biological weapons, DNA, chemicals, flavours and fragrances). The high molecular weight (90-250 kD) of spider silk proteins can be produced on a commercial scale (at over spider silk proteins can be produced on a commercial scale (at over spider silk proteins). It has better tensile strength and elasticity than commercial scale for the produced on a commercial scale (at over silkworm silk, included by the repetitive and non-repetitive regions High strength film; fibre; woven article; parachutes; sails; absorber; body armour; heavy metal; biological weapon; chemical; flavour; fragrance; Nephila clavipes; ss. 11.3%; Score 38.8; DB 18; Length 2004; 50.0%; Pred. EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orif) and a gene encoding protein or RNA of interest. Bucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant rapid and reliable method of stably expressing multiple genes of interest. This provides a transfected cells. The episomes useful in the transfection of genes encoding receptors, transporter proteins ion channels, adhesion of genes molecules and transfection of genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA

                                                                                                                                                        Costal-2 is a kinesin-related protein in the Hedgehog signaling pathway. The invention concerns novel secreted and transmembrane proteins, designated PRO polypeptides. The cDNA and gene sequences are useful in the recombinant production of PRO polypeptides, as a hybridization probe to screen libraries to isolate cDNAs with sequence identity to PRO polypeptides or to map the gene encoding the PRO polypeptides and analyzing genetic disorders. The cDNA/gene can also be used to produce transgenic animals useful for the development and screening of therapeutically useful reagents. They can also be used the gene therape, e.g. to replace a defective gene.

This invention describes novel DNA sequences (1) for specific detection of Pseudomonas putida KT2440. The invention also describes (1) recombinant expression vector containing (1); (2) prokaryotic or excombinant expression vector containing (1); (2) prokaryotic or eukaryotic cells transformed or transfected with (1) or the vector of (1); (3) production of expression products by culturing cells of (2); (2) proteins or peptides with the same sequences (A); (5) poly- or proteins or peptides with the same sequences (A); (5) poly- or proteins or peptides with the same sequences (A); (5) poly- or proteins or peptides with the same sequences (A); (5) poly- or plants that contain transformed or transfected cells of (2); (8) that the contain transformed or transfected cells of (2); (8) that that contain transformed or transfected cells of (2); (8) that that contain transformed or transfected cells of (2); (8) that that contain transformed or transfected cells of (2); (8) that that contain transformed or transfected cells of (2); (1) transgenic of detecting KT2440 using a labeled (1) or Ab as probe; and (9) DNA chips of (2); (8) that transfected the production of transgenic plants, (1), (1), and their transments, are used for detecting the presence of KT2440, particularly in presence of other.

Cor antibodies that recognize their expression products, are used for detecting the presence of KT2440, particularly in presence of other.

Cor antibodies that recognize their expression products, are used for detecting the presence of KT2440, particularly in presence of other.

Cor antibodies that recognize their expression products, are used for detecting the presence of KT2440, particularly in presence of other.

Cor antibodies that recognize their expression products, are used for detecting the National Institutes of Health, for genetic engineering work, e.g. as microbial production strains, for bological remediation and as vaccine carriers (1) are exclusive to KT2440 with no significant has a reason of the particular of the p

DNA sequence of human PPP2R2B

30-MAR-2001; 2001WO-US08631

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The chair and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and on the produce other types of the invention of mutations of the invention of the printed diagnostic coding sequences of the invention of the printed specification, but was obtained in electronic format directly from MIPO are the contract of the printed are the contract of the pri

```
The invention relates to a microsatellite marker located on human chromosome 5q31-33 between markers D5S402 and WI-6763, comprising a variable number of CAG trinucleotide repeats. The marker is useful for CAG trinucleotide repeats in a 5'-untranslated region of an allele of PPP2RBbeta, a brain specific regulatory subunit of protein phosphatase PP2A, where if a number greater than 40 js determined, an expansion which is associated with SCAI2 is indicated. The presence of expanded trinucleotide repeats on chromosome 5q31-33 is useful for predicting or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ï
                                                                                                                                                                                                                                                                                             diagnosing SCA12. Also provided are primers useful for amplifying the microsatellite marker associated with SCA12 and for diagnosing SCA12 and a probe useful for detecting expansions in a microsatellite marker

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes a hypersensitive response elicitor from Pseudomonas solanacearum. The elicitor may be used in a new method for imparting pathogen resistance to plants, by application of the elicitor in a non-infectious form to plant cells, by spraying, injection, leaf abrasion, or plant infection with recombinant bacteria (non-infectious to the host plant, e.g. Escherichia coll) expressing the elicitor as a biological control agent, to alllow recombinant protein infiltration into the plant. The method confers virus, bacterium or fungus disease-resistance on crops and

polypeptide or protein to control insects on plants or plants grown from seed treated with HRE. Also claimed is a method of insect control for plants that involves: (a) providing a transgenic plant or seed transformed with a DAM molecule (see AAV54606-09) encoding a HRE polypeptide or protein (see AAW75862-67); and (b) growing the transgenic plants or transgenic plants produced from the transgenic seeds to control insects. HRE prevents direct insect damage to plants by feeding injury. It kills insects close to plants, and interferes with insect larval feeding on such plants. It also prevents insects from colonising host plants and releasing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of hypersensitive response elicitor polypeptide - for application to plants or seeds or transgenic plants or seeds for the control of insects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This DNA sequence comprises an open reading frame that encodes a hypersensitive response elicitor (HRE) (see AAW75865 of Pseudomonas solanacearum. The invention relates to the use of a HRE
                                                                                                                                                                                                            solanacearum hypersensitive response elicitor DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 1035;

```
This DNA sequence comprises an open reading frame that encodes a hypersensitive response elicitor (HEE) (see AAWG5457) of pseudomonas solanacearum. A method of enhancing growth in plants comprises:

(a) applying a HRE polypeptide or protein in a non-infectious form to a plant or plant sed under conditions effective to enhance or growth of the plant or plants grown from the seed, or (b) providing a transgenic plant or plant sed transformed with a DNA molecule conditions at a plant produced from the transgenic seed under conditions effective to enhance plant growth. HRES (see AAW65454-59) or nucleic acids (see AAV65454-57) encoding them can be used to increase plant growth. THE RES may also result in increased plant height and growth, and effect early germination and maturation of plant seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

a coding region for a hypersensitive elicitor protein (HRE, see hAW61115). The invention relates to methods of imparting hypersensitive response induced resistance to plants by treatment of seeds. Isolated HRE polypeptides can be applied to seeds as a means of imparting pathogen resistance to plants grown from the seeds. Alternatively, bacteria containing the gene encoding the HRE can be applied to the plant seeds, or transgenic plant seeds containing a DNA molecule encoding an HRE polypeptide sequences from Erwinia chrysanthemi, are used. HRE polypeptide sequences from Erwinia chrysanthemi, and the montaining a DNA molecule encoding and ARE polypeptide sequences from Erwinia chrysanthemi, and the molecule provided. The methods can impart pelargonii (see AAM61113-18) are provided. The methods can impart environment or pathogenic to the plant seed being treated, or to

The present sequence encodes a hypersensitive response elicitor protein (also called hairpin protein) that is able to elicit a hypersensitive response in plants. The specification also describes hypersensitive response elicitors from other pathogenic organisms. The protein, in non-infectious form, is applied to plants to impart disease resistance (to a wide range of viral, bacterial and fungal pathogens), to improve growth (yield, quantity and quality of seeds, to provide earlier germination etc.) and to control insects (e.g. corn borers, Lepidoptera larvae etc.) The same results are provided by transgenic plants expressing the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New fragments of an Erwinia hypersensitive response elicitor protein and related DNA - used to impart disease resistance to plants, to increase their growth and to control insects
                                                                                                                                                                                                                                                                                                                                                                      /*tag= a

DNA encoding a hypersensitive response elicitor protein.

08-AUG-2000 (first entry)

```
The patent discloses a method to impart stress resistance to plants by applying a hypersensitive response elicitor in a non-infectious form to a plant or seed. The present sequence is a DNA encoding hypersensitive response elicitor protein from Pseudomonas solanacearum. The present sequence is used to transform transgenic plant or plant seeds to impart stress resistance.
                                                                                                     Pseudomonas solanacearum hypersensitive response elicitor encoding DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Application of a hypersensitive response elicitor protein to plants impart stress resistance
                                                                                                                                  Hypersensitive response elicitor; environmental stress resistance;

polypeptide. The specification discribes hypersensitive response elicitor polypeptide fragments, which do not elicit a hypersensitive response elicitor polypeptide fragments, which do not elicit a hypersensitive response. Instead, the proteins impart disease resistance to plants, enhance plant growth, and/or control insects. The polypeptide fragments may be used to these properties to plants. The plants which may be treated in this way include vegetables, crops and ornamental plants such as alfalfa, rice, wheat, barley, rye, cotton, sunflower, cendive, cabbage, bussel sprout, bear, parsnap, turnip, caulflower, endive, cabbage, bussel sprout, beet, parsnap, turnip, calificower, corrot, squash, pumpkin, zucchini, cucumber, apple, pear, melon, citrus, strawberry, grape, raspberry, pineapple, soybean, tobacco, tomato, sorghum or sugarcane, Arabidosis thaliana, Saintpaulia, petunia, pelargonium, poinsettia, chrysanthemum, carnation or zinnia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        712 agcgaagaccagggcggcctcaccggcgtgctgcaaaagctgatgaagatcctgaacgcg 771

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. /cgn2_6/ptodata/2/ina/5A_COMB.seq:*
